Abstract. The microwave-powered electron linear accelerator, or linac, is becoming the dominant radiotherapy treatment unit. Several technical advances, combined with attention to how patients are most effectively set up and treated, have led to continuing improvements in linac radiotherapy. This review describes: improvements in accelerator structures, widely variable energy linacs, microtrons, beam transport systems, and treatment head design.

During the 1950s and 1960s, Varian Associates invented or commercialized many technologies, including X-ray tubes and linear accelerators. In the late 1960s, the company developed the medical linear accelerator for radiation therapy. Ultimately, linear accelerators displaced cobalt as the radiation therapy method of choice.

An RF linear accelerator (LINAC) for applications in the medical field is a device that uses electromagnetic waves, in the microwave range, to accelerate charged particles such as electrons. Some medical and industrial applications employ the resulting accelerated high-energy particle beams.

A medical linear accelerator (LINAC) customizes high energy x-rays or electrons to conform to a tumor's shape and destroy cancer cells while sparing surrounding normal tissue. It features several built-in safety measures to ensure that it will deliver the dose as prescribed and is routinely checked by a medical physicist to ensure it is working properly.

The possibility of photonuclear production of Cu and Mo medical radioisotopes using linear electron accelerators was investigated. The  $^{100}\text{Mo}(\gamma, n)^{99}\text{Mo}$  reaction was considered as a case study for photoneutron production. Monte-Carlo simulations were performed and the  $^{99}\text{Mo}$  activity was predicted to be about 7 MBq/(g  $\times$  kW  $\times$  h). Irradiating 1 g target for 10 using 10 kW electron LINAC would result in 700 MBq.

A new development in the design of particle accelerators is the plasma wakefield accelerator, using a beam or a laser. The laser wakefield plasma accelerator (LWPA), combined with electrons or protons, can increase the effectiveness of radiation on tumors and reduce side effects. Plasma Therapy

## **The Medical Applications of Particle Accelerators**

A linear particle accelerator is a type of particle accelerator that accelerates charged subatomic particles or ions to a high speed by subjecting them to a series of oscillating electric potentials along a linear beamline. The principles for such machines were proposed by Gustav Ising in 1924, while the first machine that worked was constructed by Rolf Widerøe in 1928 at the RWTH Aachen University. Linacs have many applications: they generate X-rays and high energy electrons for medicinal ...

A device that accelerates radioactive particles and beams to body regions affected by malignancy, while minimising damage to normal tissue. Linear accelerators use electrodes and gaps arranged in a straight line, proportioned so when electrical potentials are varied with the proper amplitude and frequency, particles passing through the waveguide receive successive increments of energy, and are therefore accelerated; the device delivers therapeutic radiation in the range of 4 to 25 million ...

Over the past 40 years, technical advances in imaging, particularly the use of medical linear accelerators, have revolutionized cancer treatments. Cancer patients are the winners here, with sub-millimeter accuracy due, in part, to accurate localization of the cancerous tumors, and the sparing of healthy tissue surrounding the treatment site.
