This detailed book collects the main methodologies used for the analysis of the activity, localization, and regulation of the components of the Mitotic Exit Network (MEN) pathway during mitotic exit in *Saccharomyces cerevisiae*, as well as for the evaluation of the roles of these proteins in other cellular processes, such as the condensation of the

rDNA, the functionality of the mitotic checkpoints, and cytokinesis. Budding yeast serves as an ideal model system for dissecting the mechanisms that regulate cell cycle progression and providing new insights into the molecular basis of cell cycle control and, thus, into the origin of diseases that arise as a consequence of problems during cell division. Therefore, although this volume concentrates on *Saccharomyces cerevisiae* as a model, it also details the implications that the research about the MEN have on our understanding of the mitotic exit process in higher eukaryotes. Written for the highly successful *Methods in Molecular Biology* series, chapters include introductions to their respective topics, lists of the
