More than 1 million teenage girls in the United States become pregnant each year; nearly half give birth. Why do these young people, who are hardly more than children themselves, become parents? The working papers for the report Risking the Future: Adolescent Sexuality, Pregnancy, and Childbearing provide additional insight into the trends in and consequences of teenage sexual behavior.

Experts estimate that nearly 60 percent of all U.S. pregnancies-and 81 percent of pregnancies among adolescents-are unintended. Yet the topic of preventing these unintended pregnancies has long been treated gingerly because of personal sensitivities and public controversies, especially the angry debate over abortion. Additionally, child welfare advocates long have overlooked the connection between pregnancy planning and the improved well-being of families and communities that results when children are wanted. Now, current issues-health care and welfare reform, and the new international focus on population-are drawing attention to the consequences of unintended pregnancy. In this climate The Best Intentions offers a timely exploration of family planning issues from a distinguished panel of experts. This committee sheds much-needed light on the questions and controversies surrounding unintended pregnancy. The book offers specific recommendations to put the United States on par with other developed nations in terms of contraceptive attitudes and policies, and it considers the effectiveness of over 20 pregnancy prevention programs. The Best Intentions explores problematic definitions-"unintended" versus "unwanted" versus "mistimed"-and presents data on pregnancy rates and trends. The book also summarizes the health and social consequences of unintended pregnancies, for both men and women, and for the children they bear. Why does unintended pregnancy occur? In discussions of "reasons behind the rates," the book examines Americans' ambivalence about sexuality and the many other social, cultural, religious, and economic factors that affect our approach to contraception. The committee explores the complicated web of peer pressure, life aspirations, and notions of romance that shape an individual's decisions about sex, contraception, and pregnancy. And the book looks at such practical issues as the attitudes of doctors toward birth control and the place of contraception in both health insurance and "managed care." The Best Intentions offers frank discussion, synthesis of data, and policy recommendations on one of today's most sensitive social topics. This book will be important to policymakers, health and social service personnel, foundation executives, opinion leaders, researchers, and concerned individuals. May

Diploma Thesis from the year 2007 in the subject Sociology - Children and Youth, , course: Diploma in Social Work, language: English, abstract: Although considerable attention has been paid to the prevalence of adolescence childbearing in Kenya today, few studies have focused on the educational consequences of the schoolgirl pregnancy. Using data collected in selected schools in Embu Municipality, this study examines the factors associated with schoolgirl pregnancy as well as the likelihood of school dropout and subsequent re-enrollment of schoolgirls who become pregnant. The analysis is derived from the data collected from secondary schoolgirls, education officials and teachers on factors that predispose girls to pregnancy, the extent to which teenage pregnancy contributes to school dropout and the eventual levels of re-admission. The data analysis shows that girls in secondary schools are actually already sexually active though they lack the relevant information to help them make the right choices as far as their sexuality is concerned. The little information that they have is not conclusive and it is evident that they yearn for information which would be useful for them. Policy on re-admission has been formulated but the extent to which it is applied is still a questionable issue. A lot of gaps also exist in record keeping of the girls who become pregnant while in school and what becomes of them when they dropout. Such records would be vital in determining for sure if these girls become pregnant before dropping out of school or otherwise and subsequently tracking them down for re-admission purposes. A question is then raised on what other factors would be causing these girls to drop out of school other than just the pregnancy. However, poverty, cultural practices and peer pressure are among the factors assumed to be predisposing girls to pregnancy from the findings of this study, while these factors in themselves would also cause dropouts. Given the increasing levels of female school participation in Kenya today through the affirmative action motion targeting the girl child, the findings of this study suggest that future studies will benefit from exploring the causal relationships between the factors mentioned above, adolescent reproductive health behavior and subsequent school attendance.
