Over the past decades it has turned out that the Fokker-Planck equation provides a powerful tool with which the effects of fluctuations close to transition points can be adequately treated and that the approaches based on the Fokker Planck equation are superior to other approaches, e.g., based on Langevin equations.

Summary The Fokker-Planck (FP) equation has several interpretations and applications, particularly for stochastic dynamic systems. For example, it can describe the time evolution of the probability density function of particle Brownian motion. This chapter

partial differential equations. Fokker, Planck, and later Kolmogorov showed that the PDE for $x; y \in \mathbb{R}^n$ and $t \geq 0$

$$\frac{\partial p(x;t;y;s)}{\partial t} = \frac{1}{2} \sum_{i,j=1}^n \sigma_{ij}^2 \frac{\partial^2 p}{\partial x_i \partial x_j} + \sum_{i=1}^n b_i(x) \frac{\partial p}{\partial x_i} = L_x p(x;t;y;s); \quad (18)$$

which is known as the Fokker-Planck equation (also the forward Kolmogorov equation) for the SDE (15).

Kolmogorov also showed that there was a second PDE defined as

$$\frac{\partial p(x;t;y;s)}{\partial s} = L_y$$

The Fokker-Planck equation becomes: $\frac{\partial p}{\partial t} = D \frac{\partial^2 p}{\partial x^2}$; $p(x; t; s) = \frac{1}{\sqrt{2Dt}} \exp\left[-\frac{(x - s)^2}{2Dt}\right]$ This is the heat equation, which is the Fokker-Planck equation for Brownian motion (Einstein, 1905). Its solution is $p(x; t; s) = \frac{1}{\sqrt{2Dt}} \exp\left[-\frac{(x - s)^2}{2Dt}\right]$

The Fokker-Planck equation can be used for computing the probability densities of stochastic differential equations. Consider the Itô stochastic differential equation : $\mathrm{d}\mathbf{X}_t = \mu(\mathbf{X}_t, t) \mathrm{d}t + \sigma(\mathbf{X}_t, t) \mathrm{d}\mathbf{W}_t$,

A Fokker-Planck equation is discretized with finite differences in [14]. Another well-established approach to discretize kinetic equations is the method of moments, applied to Fokker-Planck equations, for instance, in [27,40],

This paper presents a primal-dual weak Galerkin finite element method for a class of second order elliptic equations of Fokker-Planck type. The method is based on a variational form where all the derivatives are applied to the test functions so that no regularity is necessary for the exact solution of the model

Download PDF Abstract: We propose a stable Petrov-Galerkin discretization of a kinetic Fokker-Planck equation constructed in such a way that uniform inf-sup stability can be inferred directly from the variational formulation. Inspired by well-posedness results for parabolic equations, we derive a lower bound for the dual inf-sup constant of the Fokker-Planck bilinear form by means of stable ...

The Fokker-Planck equation is one example of a two-way diffusion equation, or a backward-forward parabolic equation. Computing numerical solutions of backward-forward parabolic equations requires non-standard numerical methods to take into account the coupling between backward and forward diffusions without over-regularizing the problem.
